Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

An interpretation of quantum mechanics is an attempt to explain how the mathematical theory of quantum mechanics "corresponds" to reality. Although quantum mechanics has held up to rigorous and extremely precise tests in an extraordinarily broad range of experiments (not one prediction from quantum mechanics is found to be contradicted by experiments), there exist a number of contending schools ...

Spectroscopy - Types of electromagnetic-radiation sources: Although flames and discharges provide a convenient method of excitation, the environment can strongly perturb the sample being studied. Excitation based on broadband-light sources in which the generation of the light is separated from the sample to be investigated provides a less perturbing means of excitation.

Em física, o centro de massas é o ponto hipotético onde toda a massa de um sistema físico está concentrada e que se move como se todas as forças externas estivessem sendo aplicadas nesse ponto.. Se o sistema for constituído por um corpo, o centro de massas pode ser considerado como o ponto onde aplicada uma força o corpo se move sem rotacionar, com torque resultante zero.
