Engineers often describe HCCI as having the highest heat efficiency of any internal combustion engine design. To start the combustion event, HCCI relies on a higher compression ratio that is similar to those found in diesel engines, but instead uses lean homogeneous injection of air and gasoline fed into the combustion chamber on the intake stroke.

An internal combustion engine (ICE) is a heat engine where the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.
