The nuclear force (or nucleon–nucleon interaction or residual strong force) is a force that acts between the protons and neutrons of atoms. Neutrons and protons, both nucleons, are affected by the nuclear force almost identically. Since protons have charge  $+1 e$ , they experience an electric force that tends to push them apart, but at short range the attractive nuclear force is strong enough to ...

The atomic nucleus is the small, dense region consisting of protons and neutrons at the center of an atom, discovered in 1911 by Ernest Rutherford based on the 1909 Geiger–Marsden gold foil experiment. After the discovery of the neutron in 1932, models for a nucleus composed of protons and neutrons were quickly developed by Dmitri Ivanenko and Werner Heisenberg.

Most of nuclear power plants operates a single-shaft turbine-generator that consists of one multi-stage HP turbine and three parallel multi-stage LP turbines, a main generator and an exciter. HP Turbine is usually double-flow reaction turbine with about 10 stages with shrouded blades and produces about 30-40% of the gross power output of the power plant unit.

Assim, o estado de equilíbrio realmente assumido por um sistema termodinâmico é, satisfeitas as restrições físicas impostas, o estado de maior entropia possível, e a remoção de uma restrição leva geralmente a um aumento da entropia do sistema composto, ou, em caso específicos (transformações reversíveis), à manutenção de seu valor, mas nunca a uma diminuição da mesma.
