Convection is the heat transfer due to the bulk movement of molecules within fluids such as gases and liquids, including molten rock (). Convection includes sub-mechanisms of advection (directional bulk-flow transfer of heat), and diffusion (non-directional transfer of energy or mass particles along a concentration gradient).

Heat & Mass Transfer - Diffusion/Convection Equation

Convective heat transfer, or convection, is the transfer of heat from one place to another by the movement of fluids, a process that is essentially the transfer of heat via mass transfer. Bulk motion of fluid enhances heat transfer in many physical situations, such as (for example) between a solid surface and the fluid.

To augment convective heat and mass transfer coefficients, ducts of irregular cross section are generally used. The most commonly used duct cross sections include sinusoidal, triangular, and hexagonal. Figure 1.11 shows the most commonly used duct cross sections for heat and mass exchangers. Some other novel structures are being developed.
